PROFESSIONAL SUMMARY

Systems Administrator at Fixter, moving into DevOps. I keep identity, access, and the device fleet running across six countries, and I am taking on more automation and infrastructure work — IAM, monitoring, GDPR tooling, and documentation a team can actually use. Previously six years at THG Ingenuity, progressing from infrastructure apprentice through to Cloud & Infrastructure Engineer.

TECHNICAL SKILLS

Identity / Access	Google Workspace, AWS IAM, Cognito, 1Password, role-based access, joiner–mover–leaver
Devices / MDM	Jamf, Apple Business Manager, Bitdefender, Deel IT, hardware procurement
Cloud / Infra	AWS (IAM, ACM, EventBridge), Postgres + bastion access, GitHub, Docker
Automation	Python, Bash, Ansible, Zapier, Git, scheduled reconciliation and alerting
Compliance	GDPR SAR and erasure, security reviews, access matrix, SaaS licensing
Linux / Hosting	RHEL family, Ubuntu, Windows Server, DNS, SSL/TLS, firewalls, cPanel/WHM

PROFESSIONAL EXPERIENCE

Systems Administrator

Fixter • August 2026 – Present

- Run joiner and leaver processing across Google Workspace, Slack, the ticket system, Jamf, 1Password, department tools, Cognito, and scoped database/bastion accounts for engineers, using a role-based access matrix so people get the access their role needs.
- Manage the device fleet and MDM: Jamf, Apple Business Manager, inventory, Bitdefender, and Deel IT. Source and reassign hardware across the UK, France, India, South Africa, Morocco, and Romania.
- Own identity and access work in AWS (IAM users, groups, roles, MFA, least-privilege reviews) and Cognito user/role management for internal applications.
- Handle GDPR subject-access and erasure requests within the 30-day window, including Python tooling for SAR export and erasure rather than one-off SQL.
- Shipped operational automation: ACM certificate-expiry alerts to Slack (after a missed auto-renewal), new-ticket alerts from the ticket system to Slack, and Jamf ↔ inventory serial-number reconciliation so fleet drift is caught instead of sitting for months.
- Building IT documentation in Notion — process articles, access and ownership records, automation candidates, and licence tracking — so the work is written down and the team can run it.
- Moving into DevOps: IAM elevation (read-only by default, MFA to elevate), GDPR script hardening, certificate and alarm hygiene, and more infrastructure the team can operate without waiting on one person.

Cloud & Infrastructure Engineer

THG Ingenuity • November 2021 – March 2026 (4 yrs 5 mos)

- L3 technical support across bare metal, VPS, and cloud Linux platforms: incidents, hardware diagnostics, firewalls (iptables/nftables), storage (RAID/LVM), DNS/SSL, and application-layer faults. On-call for high-priority and VIP work.
- Day-to-day infrastructure: OS installs, performance tuning, customer and internal environments, and eight months embedded with Linux Operations supporting production and development.
- Alongside that L3 role, built internal ops tooling the team used daily: a unified support dashboard (three ticketing platforms, RBAC, two-tier cache), out-of-hours paging with four escalation tiers, Zabbix agent rollout via Ansible across 500+ servers, and active-passive DR with 60-second replication between two data centres.
- Wrote runbooks and knowledge-base articles so common work was documented, not trapped with one engineer.

Hosting Support Engineer

THG Ingenuity • September 2020 – November 2021 (1 yr 3 mos)

• Escalation point for complex hosting issues across shared, VPS, and dedicated servers (DNS, web, email, SSL/TLS, cPanel/Plesk); kept the knowledge base current so common work was documented.

Infrastructure Technician Apprentice

THG Ingenuity • August 2019 – September 2020 (1 yr 2 mos)

• Technical support by phone, email, and live chat; Hyper-V, Windows Server, and PowerShell. Completed BCS Level 3 Infrastructure Technician apprenticeship.

EDUCATION & CERTIFICATIONS

• Actively studying towards RHCSA / RHCE (self-directed labs and coursework).

• VMware VCTA–DCV • Microsoft MTA (Networking, Cloud, Mobility & Device) • BCS Level 3 Infrastructure Technician.
